

Onsite septic treatment systems are becoming increasingly common in Florida; especially in nitrogen sensitive areas such as river springs and basins. There are a number of state-approved treatment systems from which you and your septic professional can choose. *Important considerations...*

Make sure the system you select has been time tested and proven.

Since 1961 Fuji Clean has built and installed over *two million* treatment systems. The company is now the largest manufacturer in the world of onsite septic treatment systems thanks to superior product performance and long-term attention to customer needs.

You want a system that is robust and uncomplicated.

Fancy “bells and whistles” and septic treatment do not mix well. Fuji Clean’s one-hole, one-tank, one-air system has no moving parts inside, requires no additives and is powered by one long-lasting linear diaphragm air blower with an expected runtime of 5+ years and that can be inexpensively rebuilt in 30 minutes.

Your system should not be a burden or an annoyance.

Above ground, Fuji Clean systems are hardly noticeable.

- Quiet (39dB - "library quiet")
- No odor
- Energy efficient (51 watts for typical residential system costs \$4.50/month in most U.S. areas)
- Small footprint, at-grade covers blend into landscape

Your system must work!

These systems have a job to do – protect water resources around you, protect the long-term health of your drain field and assure the safety of your drinking water. Fuji Clean's technical team of engineers, scientists and technicians constantly work to upgrade technology, trouble-shoot problems and test systems around the country to improve product performance.

Nationally tested and certified.

- 92%-98% pollutant removal (Fuji Clean performance: 50% better than the national standard).
- 70% removal of nitrogen compounds (Fuji Clean performance: 40% better than the national standard).

Easy and effective maintenance is critical.

All onsite treatment systems must be maintained. But not all systems are created equal when it comes to maintenance. Fuji Clean systems are designed for exceptionally efficient servicing, which consists primarily of a routine flushback cleaning procedure managed by a technician simply turning valves. No filters are removed, no special equipment is required. Professional installers and maintenance providers tell us every day, "Easiest system to install and maintain ever!"

Your system is backed by local professionals *and* the system manufacturer

At Fuji Clean, we have made a huge effort to develop a network of experienced and conscientious local wastewater professionals. Whether it's a site evaluation, design, installation or service, we want the top professionals working with your best interest in mind. Most important, at Fuji Clean USA, we consider it our responsibility that ALL Fuji Clean systems operate as designed and that our customer is always satisfied.
